

Play Cards

Take the program written last weekend that creates a deck of cards, shuffles them, and then lists them out.

Modify the program to 'deal' two hands of cards (two players). Each player will be dealt 5 cards. Deal one to the first player, then one to second player. Repeat until both players have 5 cards in their hand.

Then compute the total points in each player's hand and determine the winner with the most points. If a player has an ace, then count that as 11 points.

Print out the winning player total points and then his cards.

Then print out the losing player total points and his cards.

Turn in both your code and a copy of the screen output.
